## 1 Introduction

The topic of this project is the Modern Olympics. The games have been a global competition since 1896 with both Summer and Winter sports. The goal is to analyse the patterns of a medal winner depending on their physical characteristics (weight, height, age, sex), home country (athleticism, GDP, population) and the games in which they compete (location). The Olympics are supposed to be a celebration of peace, inclusion and human persistence. It is an opportunity for people to be proud of their country, and be in awe of the feats of athletes. By exploring the above topics it may be possible to determine whether there is a fair representation at the Olympics, and whether the winners are too predictable. If this is the case than the Olympics are no longer serving their purpose.

### 2 About the data

To explore and understand how the Olympics has changed over time, a variety of data was collected from numerous sources. There are three main sources broken up over five datasets.

#### 2.1 Athlete Information

The first set of data that needs to be collected relates to the Athlete's information. This includes their physical characteristics (height, weight, age), their role in the Olympics (sport, medal, country) and when they competed (season, year). This information is available for public download on Kaggle under the title '120 years of Olympic history (1896 - 2018)'. This dataset was created by scraping from www.sport-reference.com. The data is broken down into two files:

1. Athlete and Events - This file contains all of the information recorded about the athlete from all Modern Olympics. The variables of interest are ID, Sex, Age, Height, Weight, NOC, Year, Season and Medal.

| ID | A Name                         | A Sex | A Age | A Height | A Weight | A Team             | A NOC | A Games        | # Year | A Season | A City          | A Sport          | A Event  | A Medal |

2. NOC regions - A list of the countries and their NOC code. It is important to note some

countries changed their code in the data. This is noted in Appendix A.

| 1  | AFG | Afghanistan |                      |
|----|-----|-------------|----------------------|
| 2  | AHO | Curacao     | Netherlands Antilles |
| 3  | ALB | Albania     |                      |
| 4  | ALG | Algeria     |                      |
| 5  | AND | Andorra     |                      |
| 6  | ANG | Angola      |                      |
| 7  | ANT | Antigua     | Antigua and Barbuda  |
| 8  | ANZ | Australia   | Australasia          |
| 9  | ARG | Argentina   |                      |
| 10 | ARM | Armenia     |                      |
| 11 | ARU | Aruba       |                      |

Figure 2: noc\_regions.csv

### 2.2 Country Information

The second set of data relates to the information about each country, including their GDP and population. The most trustworthy source for this data publicly available from World Bank national accounts data, and OECD National Accounts data files. The data is available from 1960 to present, and is accessed as separate files.

1. GDP - The GDP for all countries, represented in current US\$.

Figure 4: population.csv

### 2.3 Host Cities

The finally set of data is location of each of the games. The 'City' is included as a column in 'athlete\_events.csv', however it is not paired with a country which is needed to compare an athlete's country with where they are competing. This data was not readily available as a data file but the information was found on <a href="https://architectureofthegames.net/olympic-host-cities/">https://architectureofthegames.net/olympic-host-cities/</a>. The data was copied into two separate text files as is; summer and winter. Using python the

files were read, reformatted and combined to create a csv file. The file contains the year, city, country and season of each Olympic games. The code is in Appendix A.

| Year | City      | Country       | Season |
|------|-----------|---------------|--------|
| 1896 | Athens    | Greece        | Summer |
| 1900 | Paris     | France        | Summer |
| 1904 | St. Louis | United States | Summer |
| 1908 | London    | England       | Summer |
| 1912 | Stockholm | Sweden        | Summer |
| 1920 | Antwerp   | Belgium       | Summer |
| 1924 | Paris     | France        | Summer |
| 1924 | Chamonix  | France        | Winter |
| 1928 | Amsterdam | Netherlands   | Summer |

Figure 5: host\_city.csv

#### 2.4 Final Dataset

From these files, a new dataset was created using pandas (and article research) to refine the data selection, remove redundancies, combine related variables and update incorrect data to ensure a cleaner dataset for the visualisations. These steps were taken to combine the following five datasets:

- 1. Remove 'Art Competitions' under 'Sport'
- 2. Remove 'Name', 'Team', 'Games', 'Event', 'Sport' from athlete\_events.csv
  - 'Name' this is not relevant
  - 'Team' sometimes contradicts NOC/Country
  - 'Games' is duplicate, already split into 'Year' and 'Season'
  - 'Event' is not relevant and not consistently
  - 'Sport' is not relevant
- 3. Remove Years 1896-1920 from athlete events.csv
  - Women didn't compete in 1896
  - Winter Games didn't commence until 1924
- 4. Make NOC codes consistent for countries that have changed.
  - Singapore (SIN): Stored as SGP in athlete\_events
  - Russia (RUS): URS (1952-1988), EUN (1992), RUS (1994-2018)
  - Taiwan (TPE): ROC (1952-1976), TPE(1984-2018)
  - China (CHN): ROC (1924-1948), CHN (1980-2018)
  - Germany (GER): GER (1896-2018), EUA (1956-1964), FRG & GDR (1968-1988)
  - Czech Republic (CZE): CZE (1994-2018), TCH (1920-1992), BOH (1900-1912)
  - Serbia (SRB): SCG (2004-2006), SRB (1912, 2008-2018), YUG (1920-2002)
- 5. Add column COUNTRY by matching 'NOC' with the same from noc\_regions.csv
- 6. Update CITY in athlete\_events.csv to match more common names used in host\_cities.csv
  - Athina to Athens
  - Roma to Rome
  - Antwerpen to Antwerp
  - Moskva to Moscow
  - Torino to Turin
  - Sankt Moritz to St Moritz

- 7. Add column HOST COUNTRY by matching 'country' with same from host\_city.csv
- 8. Add column GDP by matching 'country' in gdp.csv
- 9. Add column POPULATION by matching 'country' in population.csv

| ID | Sex | ٨٥٥ | Height | Weight | Year | Season | City        | Host Country | Model | NOC  | Country     | GDP                  | Population    |

Figure 6: all\_data.csv

## 3 Discussion

The prediction of medal winners will be explored through a number of topics. Each of these will be presented as a comparison between the winter and summer games. Data will be considered from 1924 (when the Winter Olympics were introduced), except for BMI, GDP and population which will be taken from 1960 (when data is collected for majority of points for these variables). The variables 'NOC', 'year' and 'season' are used for all analysis. From current knowledge these are possible visualisations that can be explored:

- The distribution of the number of events and medals [Histogram (#events, #medal)]
- The change in age for medal and non-medal winners [Turkey box (year v. age)]
- The BMI of medal and non-medal winners [q-q plot (medal v. non-medal BMI)]
- The proportion of medal winners to number athletes [scatter (#athletes v. #medals)]
- The proportion of men and women competing [scatter (#females v. #males)]
- The difference in % of medals when competing at host [scatter (% hosting v. visiting)]
- The effect of population and GDP on number of medals [multi pop, GDP, #medals]

## Appendices

## A Important notes about the data

- 1. athlete\_events.csv Possible factors that may affect results of each Olympics
  - 1924: Winter games commence
  - 1928: Women now compete in more than 2 sports
  - 1932: Low attendance due to Great Depression
  - 1940 & 1944: Cancelled due to WW2
  - 1948: Art sports (architecture, literature, music, painting, sculpture) removed
  - 1952: USSR/Russia starts competing, Republic of China (ROC) discontinued
  - 1956: Boycotts by 8 nations, including China
  - 1960: Height and Weight measured consistently from now
  - 1976: Boycotts by 25 nations (mostly from Africa)
  - 1980: Boycotts by 66 nations, including US
  - 2000: Summer Olympics capped at 28 sports, 300 events, 10,000 athletes
- 2. noc\_regions.csv The following countries are recorded under multiple codes:
  - Australia: AUS, ANZ (New Zealand, 19081912)
  - Russia: URS (19521988), EUN (1992), RUS (19942018)
  - China: ROC (19241948), CHN (19522018), HKG (Hong Kong, 19522018)
  - Germany: GER (18962018), EUA (19561964), FRG & GDR (19681988)
  - Czech Republic: CZE (19942018), TCH (19201992), BOH (19001912)
  - Serbia: SCG (20042006), SRB (1912, 20082018), YUG (19202002)

## Appendices

### A About the data

#### A.1 Host Cities

```
import pandas as pd
def get_season_df(file_name, season):
    host_data = []
    with open(file_name) as file_var:
        for line in file_var.readlines():
                year = line [:5]
                location = line [6:-1]. split (', ', ')
                city = location [0]
                country = location [1]
                host_data.append([year, city, country, season])
    season_df = pd.DataFrame(host_data, columns=['Year',
                                                  'Host_Country',
                                                  'Season'])
    return season_df
# Read in the data for each seasons
summer_df = get_season_df(
    'F:/TEAN/Portfolio/olympics/code/host_summer.txt', 'Summer')
winter_df = get_season_df(
    'F:/TEAN/Portfolio/olympics/code/host_winter.txt', 'Winter')
# Combine to create 1 DF
host_df = pd.merge(summer_df, winter_df, how='outer').reset_index(drop = True
#Check if all cities accounted for:
athlete_df = pd.read_csv(
                'F:/TEAN/Portfolio/olympics/data/athlete_events.csv')
