Contents

1   Introduction

The topic of this project is the Modern Olympics. The games have been a global competition since 1896 with both Summer and Winter sports. The goal is to analyse the patterns of a medal winner depending on their physical characteristics (weight, height, age, sex), home country (athleticism, GDP, population) and the games in which they compete (location). The Olympics are supposed to be a celebration of peace, inclusion and human persistence. It is an opportunity for people to be proud of their country, and be in awe of the feats of athletes. By exploring the above topics it may be possible to determine whether there is a fair representation at the Olympics, and whether the winners are too predictable. If this is the case than the Olympics are no longer serving their purpose.

2   About the data

To explore and understand how the Olympics has changed over time, a variety of data was collected from numerous sources. There are three main sources broken up over five datasets.

2.1   Data Sources

2.2   Athlete Information

The first set of data that needs to be collected relates to the Athlete's information. This includes their physical characteristics (height, weight, age), their role in the Olympics (sport, medal, country) and when they competed (season, year). This information is available for public download on Kaggle under the title '120 years of Olympic history (1896 - 2018)'. This dataset was created by scraping from www.sport-reference.com. The data is broken down into two files:

1. Athlete and Events - This file contains all of the information recorded about the athlete from all Modern Olympics. The variables of interest are ID, Sex, Age, Height, Weight, NOC, Year, Season and Medal.

ID	A Name	A Sex	A Age	A Height	A Weight	A Team	A NOC	A Games	# Year	A Season	A City	A Sport	A Event	A Medal
1	A Dijiang	M	24	180	80	China	CHN	1992 Summer	1992	Summer	Barcelona	Basketball	Basketball Men's Basketball	NA
2	A Lamusi	M	23	170	60	China	CHN	2012 Summer	2012	Summer	London	Judo	Judo Men's Extra-Lightweight	NA
3	Gunnar Nielsen Aaby	M	24	NA	NA	Denmark	DEN	1920 Summer	1920	Summer	Antwerpen	Football	Football Men's Football	NA
4	Edgar Lindenau Aabye	M	34	NA	NA	Denmark/Sweden	DEN	1900 Summer	1900	Summer	Paris	Tug-Of-War	Tug-Of-War Men's Tug-Of-War	Gold
5	Christine Jacoba Aaftink	F	21	185	82	Netherlands	NED	1988 Winter	1988	Winter	Calgary	Speed Skating	Speed Skating Women's 500 metres	NA
5	Christine Jacoba Aaftink	F	21	185	82	Netherlands	NED	1988 Winter	1988	Winter	Calgary	Speed Skating	Speed Skating Women's 1,000 metres	NA
5	Christine Jacoba Aaftink	F	25	185	82	Netherlands	NED	1992 Winter	1992	Winter	Albertville	Speed Skating	Speed Skating Women's 500 metres	NA
5	Christine	F	25	185	82	Netherlands	NED	1992	1992	Winter	Albertville	Speed	Speed	NA

Figure 1: athlete_events.csv

2. NOC regions - A list of the countries and their NOC code. It is important to note some countries changed their code in the data. This is noted in Appendix A.

1	AFG	Afghanistan	
2	AHO	Curacao	Netherlands Antilles
3	ALB	Albania	
4	ALG	Algeria	
5	AND	Andorra	
6	ANG	Angola	
7	ANT	Antigua	Antigua and Barbuda
8	ANZ	Australia	Australasia
9	ARG	Argentina	
10	ARM	Armenia	
11	ARU	Aruba	

Figure 2: noc_regions.csv

2.3   Country Information

The second set of data relates to the information about each country, including their GDP and population. The most trustworthy source for this data publicly available from World Bank national accounts data, and OECD National Accounts data files. The data is available from 1960 to present, and is accessed as separate files.

1. GDP - The GDP for all countries, represented in current US$.

	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
China	5,101,702,432,8	6,087,164,527,4	7,551,500,425,5	8,532,230,724,1	9,570,405,758,7	10,438,529,153	11,015,542,352	11,137,945,669	12,143,491,448	13,608,151,864

Figure 4: population.csv

2.4 Host Cities

The finally set of data is location of each of the games. The 'City' is included as a column in 'athlete_events.csv', however it is not paired with a country which is needed to compare an athlete's country with where they are competing. This data was not readily available as a data file but the information was found on https://architectureofthegames.net/olympic-host-cities/. The data was copied into two separate text files as is; summer and winter. Using python the files were read, reformatted and combined to create a csv file. The NOC was also added as an additional column manually using noc_regions.csv. The file contains the year, city, country, NOC and season of each Olympic games. The code is in Appendix A.

Year	City	Country	Season
1896	Athens	Greece	Summer
1900	Paris	France	Summer
1904	St. Louis	United States	Summer
1908	London	England	Summer
1912	Stockholm	Sweden	Summer
1920	Antwerp	Belgium	Summer
1924	Paris	France	Summer
1924	Chamonix	France	Winter
1928	Amsterdam	Netherlands	Summer

Figure 5: host_city.csv

2.5 Data Parsing

2.6 Combined Dataset

From all of the above files, a new dataset was created using pandas (and article research) to refine the data selection, remove redundancies, combine related variables and update incorrect data to ensure a cleaner dataset for the visualisations. These steps were taken to combine the following five datasets:

1. Remove 'Art Competitions'
2. Remove 'Name', 'Team', 'Games', 'Season from athlete_events.csv
   - 'Name' - the identification of the athletes is not important
   - 'Team' - sometimes contradicts NOC/Country
   - 'Games' - duplicate of year and season
   - 'Season' - only looking at summer games
3. Make NOC codes consistent for countries that have changed.

- Singapore (SIN): Stored as SGP in athlete_events
- Russia (RUS): URS (1952-1988), EUN (1992), RUS (1994-2018)
- Taiwan (TPE): ROC (1952-1976), TPE(1984-2018)
- China (CHN): ROC (1924-1948), CHN (1980-2018)
- Germany (GER): GER (1896-2018), EUA (1956-1964), FRG & GDR (1968-1988)
- Czech Republic (CZE): CZE (1994-2018), TCH (1920-1992), BOH (1900-1912)
- Serbia (SRB): SCG (2004-2006), SRB (1912, 2008-2018), YUG (1920-2002)

4. Add column COUNTRY by matching 'NOC' with the same from noc_regions.csv

5. Update host CITY in athlete_events.csv to match more common names used in host_cities.csv

- Athina to Athens
- Roma to Rome
- Antwerpen to Antwerp
- Moskva to Moscow
- Torino to Turin
- Sankt Moritz to St Moritz

6. Add column HOST NOC by matching 'NOC' with same from host_city.csv

7. Add column for BMI

8. Add column with boolean value corresponding to have a medal winner

9. Add column GDP by matching 'country' in gdp.csv

10. Add column POPULATION by matching 'country' in population.csv

ID	Sex	Age	Height	Weight	Year	Season	City	Host Country	Medal	NOC	Country	GDP	Population
1	M	24	180	80	1992	Summer	Barcelona	Spain	NA	CHN	China	426,915,712,711.10	1,164,970,000

Figure 6: all_data.csv

2.7 Summer Dataset

After looking at the data and testing some preliminary graphs, there were a few additional changes to be made.

Remove Years 1896-1952 from athlete_events.csv

- Women didn't compete in 1896
- Winter Games didn't commence until 1924
- China and USSR joined in 1952
- The recording of more than 40% of weight and height started in 1956. Over 90% since 1960.
- The GDP and population is not available until 1960

Remove 'Winter' season, as not only will this overcomplicate the results and comparisons, but also Summer has a lot more data which will skew the outputs.

- Summer has 2.3 times more countries each year
- Summer has 2.3 times more sports each year
- Summer has 4 times more athletes competing
- summer has 3 times more events

Remove 'Season' and 'Games' columns

With these changes, a new table was created with just Summer Olympics from 1956 with the above data.

3   Discussion

The prediction of medal winners will be explored through a number of topics. Due to the difference n data size and added complexity, as explained in the data section, only data from the Summer Olympics since 1956 will be considered.

3.1   How have the games changed?

3.2   What are the characteristics of an Olympic Athlete?

3.3   Is there a difference in physicality between athletes and winners?

3.4   Which countries are the best at the Olympics and how do they differ?

3.5   Is the competition fair?

- The distribution of the number of events and medals [Histogram (#events, #medal)]
- The change in age for medal and non-medal winners [Turkey box (year v. age)]
- The BMI of medal and non-medal winners [q-q plot (medal v. non-medal BMI)]
- The proportion of medal winners to number athletes [scatter (#athletes v. #medals)]
- The proportion of men and women competing [scatter (#females v. #males)]
- The difference in % of medals when competing at host [scatter (% hosting v. visiting)]

- The effect of population and GDP on number of medals [multi pop, GDP, #medals]

Appendices

A   Important notes about the data

1. athlete_events.csv - Possible factors that may affect results of each Olympics

   - 1924: Winter games commence
   - 1928: Women now compete in more than 2 sports
   - 1932: Low attendance due to Great Depression
   - 1940 & 1944: Cancelled due to WW2
   - 1948: Art sports (architecture, literature, music, painting, sculpture) removed
   - 1952: USSR/Russia starts competing, Republic of China (ROC) discontinued
   - 1956: Boycotts by 8 nations, including China
   - 1960: Height and Weight measured consistently from now
   - 1976: Boycotts by 25 nations (mostly from Africa)
   - 1980: Boycotts by 66 nations, including US
   - 2000: Summer Olympics capped at 28 sports, 300 events, 10,000 athletes

2. noc_regions.csv - The following countries are recorded under multiple codes:

   - Australia: AUS, ANZ (New Zealand, 19081912)
   - Russia: URS (19521988), EUN (1992), RUS (19942018)
   - China: ROC (19241948), CHN (19522018), HKG (Hong Kong, 19522018)
   - Germany: GER (18962018), EUA (19561964), FRG & GDR (19681988)
   - Czech Republic: CZE (19942018), TCH (19201992), BOH (19001912)
   - Serbia: SCG (20042006), SRB (1912, 20082018), YUG (19202002)

Appendices

A   About the data

A.1   Host Cities

```python
import pandas as pd

def get_season_df(file_name, season):
    host_data = []
    with open(file_name) as file_var:
        for line in file_var.readlines():
                year = line[:4]
                location = line[6:-1].split(', ')
                city = location[0]
                country = location[1]
                host_data.append([year, city, country, season])

    season_df = pd.DataFrame(host_data, columns=['Year',
                                                 'City',
                                                 'Host_Country',
                                                 'Season'])
    return season_df

# Read in the data for each seasons
summer_df = get_season_df(
    'F:/TEAN/Portfolio/olympics/data/host_summer.txt', 'Summer')
winter_df = get_season_df(
    'F:/TEAN/Portfolio/olympics/data/host_winter.txt', 'Winter')
# Combine to create 1 DF
host_df = pd.merge(summer_df, winter_df, how='outer').reset_index(drop = True

#Check if all cities accounted for:
athlete_df = pd.read_csv(
                'F:/TEAN/Portfolio/olympics/data/athlete_events.csv')

for host_city in host_df.City.unique():
    for athlete_city in athlete_df.City.unique():
        if (host_city not in host_df.City.unique()) \
                and (athlete_city not in host_df.City.unique()):
            print("Host City: ", host_city)
            print("Athlete City: ", athlete_city)

# Write to CSV
host_df.to_csv('F:/TEAN/Portfolio/olympics/data/host_countries.csv')
```
